

IN THE CLAIMS:

Please amend claims 1, 5, 25-26, 31, 34, 38, 54, 58, and 62 as follows.

1. (Currently Amended) A method, comprising:

determining a type of an access network via which a service is to be provided to a user equipment; and

enforcing at ~~the~~ a gateway in the provisioning of said service via said access network a traffic flow control policy decided on the basis of information regarding the type of the access network,

wherein said access network is located between the user equipment and the gateway.

2. (Previously Presented) A method as claimed in claim 1, comprising:

receiving data from an entity associated with the access network at the gateway;
and

determining the type of the access network based on said data.

3. (Previously Presented) A method as claimed in claim 2, comprising receiving type information from the entity at the gateway.

4. (Previously Presented) A method as claimed in claim 2, wherein the entity associated with the access network comprises a node connected to the access network.
5. (Currently Amended) A method as claimed in claim 2, wherein the entity associated with the access network comprises a said user equipment.
6. (Previously Presented) A method as claimed in claim 2, comprising receiving a request for a data bearer at the gateway.
7. (Previously Presented) A method as claimed in claim 6, wherein the request for a data bearer includes information regarding the type of the access network.
8. (Previously Presented) A method as claimed in claim 6, wherein the request comprises another request for creation of a packet data protocol context.
9. (Previously Presented) A method as claimed in claim 1, wherein the determining comprises determining the type in the gateway.
10. (Previously Presented) A method as claimed in claim 1, comprising receiving at the gateway a message from an entity associated with the access network, and wherein

the determining comprises determining the type of an access network based on the address of the entity associated with the access network.

11. (Previously Presented) A method as claimed in claim 1, comprising receiving at the gateway a message from an entity associated with the access network, and wherein the determining comprises:

determining the type of the access network supported by the entity associated with the access network; and

determining the type of the access network from the access type supported by the entity associated with the access network.

12. (Previously Presented) A method as claimed in claim 1, comprising receiving at the gateway a message from an entity associated with the access network, and wherein the determining comprises determining the type of the access network based on a characteristic of said message received from the entity associated with the access network at the gateway.

13. (Cancelled)

14. (Previously Presented) A method as claimed in claim 1, comprising determining in the gateway if a service specific policy is already available for the identified communication session.

15.-19. (Cancelled)

20. (Previously Presented) A method as claimed in claim 1, wherein the deciding comprises selecting an access network specific policy.

21. (Original) A method as claimed in claim 1, further comprising determining if the access network operates in accordance with one of:

a second generation standard, a third generation standard, or a wireless local area network standard.

22. (Previously Presented) A method as claimed in claim 1, wherein the traffic flow control policy is a service specific policy.

23. (Previously Presented) A method as claimed in claim 1, wherein the information regarding the type of the access network is one of a quality of service policy, a security policy, and a charging rule.

24. (Cancelled)

25. (Currently Amended) A computer program embodied on a computer readable medium, the computer program configured to control a processor to decide a traffic flow control policy for controlling communications in a communication system, comprising:

determining a type of an access network via which a service is to be provided to a user equipment; and

enforcing at a gateway in the provisioning of said service via said access network a traffic flow control policy decided on the basis of information regarding the type of the access network,

wherein said access network is located between the user equipment and the gateway.

26. (Currently Amended) A communication system comprising:

different access networks;

a gateway configured to communicate with entities associated with the different access networks;

an access network type determination processor configured to determine a type of an access network of the different access networks via which a service is to be provided to a user equipment; and

a decision making processor configured to decide a traffic flow control policy to apply to communications via the gateway based on information of the type of the access network,

wherein the communication system is configured to control communications based on decisions by the decision making processor, and said access networks are located between the user equipment and the gateway.

27.-30. (Cancelled)

31. (Currently Amended) An apparatus, comprising:

an access network type determining processor configured to determine a type of an access network via which a service is to be provided to a user equipment; and

an enforcing processor configured to enforce at a gateway in the provisioning of said service via said access network a traffic flow control policy decided on the basis of information of the type of the access network,

wherein said access network is located between the user equipment and the gateway.

32.-33. (Cancelled)

34. (Currently Amended) An apparatus, comprising:

access network type determining means for determining a type of an access network via which a service is to be provided to a user equipment; and

enforcing means for enforcing at a gateway in the provisioning of said service via said access network a traffic flow control policy decided on the basis of information regarding the type of the access network,

wherein said access network is located between the user equipment and the gateway.

35. (Previously Presented) An apparatus as claimed in claim 31, wherein the access network type determining processor is configured to determine the type of the access network based on data received at the gateway from an entity associated with the access network.

36. (Previously Presented) An apparatus as claimed in claim 35, comprising a receiver configured to receive type information from the entity at the gateway.

37. (Previously Presented) An apparatus as claimed in claim 35, wherein the entity associated with the access network comprises a node connected to the access network.

38. (Currently Amended) An apparatus as claimed in claim 35, wherein the entity associated with the access network comprises a said user equipment.

39. (Previously Presented) An apparatus as claimed in claim 35, comprising a receiver configured to receive a request for a data bearer at the gateway.

40. (Previously Presented) An apparatus as claimed in claim 39, wherein the request for a data bearer includes information regarding the type of the access network.

41. (Previously Presented) An apparatus as claimed in claim 39, wherein the request comprises another request for creation of a packet data protocol context.

42. (Previously Presented) An apparatus as claimed in claim 31, wherein the access network type determining processor is provided at the gateway.

43. (Previously Presented) An apparatus as claimed in claim 31, comprising a receiver configured to receive at the gateway a message from an entity associated with the access network, and wherein the access network type determining processor is configured to determine the type of an access network based on the address of said entity associated with the access network.

44. (Previously Presented) An apparatus as claimed in claim 31, comprising a receiver configured to receive at the gateway a message from an entity associated with the access

network, and wherein the access network type determining processor is configured to determine the type of the access network supported by the entity associated with the access network, and determine the type of the access network from the access type supported by the entity associated with the access network.

45. (Previously Presented) An apparatus as claimed in claim 31, comprising a receiver configured to receive at the gateway a message from an entity associated with the access network, and wherein the access network type determining processor is configured to determine the type of the access network based on a characteristics of said message received from the entity at the gateway.

46. (Previously Presented) An apparatus as claimed in claim 31, further comprising an identifying processor configured to identify a communication session by the gateway.

47. (Previously Presented) An apparatus as claimed in claim 46, comprising a determining processor configured to determine in the gateway if a service specific policy is already available for the identified communication session.

48. (Previously Presented) A method as claimed in claim 1, comprising receiving at the gateway from a policy control entity a plurality of traffic flow control policies, and

selecting one of said plurality traffic flow control policies based on said information regarding the type of the access network.

49. (Previously Presented) An apparatus as claimed in claim 31, comprising a receiver configured to receive at the gateway from a policy control entity a plurality of traffic flow control policies, and a decision making processor configured to select one of said plurality traffic flow control policies based on said information regarding the type of the access network.

50. (Previously Presented) A method as claimed in claim 1, comprising:

sending from the gateway to a policy control entity a message including an indication of the type of the access network via which the service is to be provided; and

receiving at the gateway from said policy control entity a message indicating said traffic flow control policy decision.

51. (Previously Presented) A method as claimed in claim 1, comprising making the traffic flow control policy decision at the gateway.

52. (Previously Presented) An apparatus as claimed in claim 31, comprising:

a transmitter configured to send from a gateway to a policy control entity a message including an indication of the type of the access network via which the service is to be provided; and

a receiver configured to receive at said gateway from said policy control entity a message indicating said traffic flow control policy decision.

53. (Previously Presented) An apparatus as claimed in claim 31, comprising a decision making processor configured to decide said traffic flow control policy at the gateway.

54. (Currently Amended) A method, comprising:

making at a policy control entity a traffic flow control policy decision using as one decision criteria a type of an access network via which a service is to be provided to a user equipment; and

sending to a gateway from said policy control entity a message indicating said traffic flow control policy decision,

wherein said access network is located between the user equipment and the gateway.

55. (Previously Presented) A method as claimed in claim 54, comprising receiving a request for said traffic flow control policy decision from the gateway, wherein the request

includes an indication of the type of the type of the access network via which the service is to be provided.

56. (Previously Presented) A method as claimed in claim 54, further comprising sending an inquiry for a subscription profile from the policy control entity to a separate database.

57. (Previously Presented) A method as claimed in claim 54, further comprising authorizing a user at the policy control entity.

58. (Currently Amended) An apparatus, comprising:

a decision making processor configured to make at a policy control entity a traffic flow control policy decision using as one decision criteria a type of an access network via which a service is to be provided to a user equipment; and

a transmitter configured to send to a gateway from said policy control entity a message indicating said traffic flow control policy decision wherein said access network is located between the user equipment and the gateway.

59 (Previously Presented) An apparatus according to claim 58, comprising a receiver configured to receive a request for said traffic flow control policy decision from the

gateway, wherein the request includes an indication of the type of the type of the access network via which the service is to be provided.

60. (Previously Presented) An apparatus as claimed in claim 58, further comprising a transmitter configured to send an inquiry for a subscription profile from the policy control entity to a separate database.

61. (Previously Presented) An apparatus as claimed in claim 58, further comprising an authorizing processor configured to authorize a user at the policy control entity.

62. (Currently Amended) An apparatus, comprising:

decision making means for making at a policy control entity a traffic flow control policy decision using as one decision criteria a type of an access network via which a service is to be provided to a user equipment; and

sending means for sending to a gateway from said policy control entity a message indicating said traffic flow control policy decision,

wherein said access network is located between the user equipment and the gateway.
